

Republic of Moldova: public knowledge about climate change

National survey

Beneficiary: Climate Change Office, Ministry
of Environment of the Republic of Moldova

Realized in the frame of the UNEP-GEF Project "Republic of
Moldova: Enabling Activities for the Preparation of Third National
Communications under the United Nations Framework Convention
on Climate Change (UNFCCC)"

Chisinau, 2012

Main conclusions

The perceived level of information about global warming and its consequences is very low, 5%-6% are considered to be well-informed; as concerning the climate system or measures that can be undertaken to reduce the effects of global warming – only 3% are declared to be very satisfied with the level of information held.

These perceptions are in fact very well emphasized in the answers of survey participants where many knowledge questions show significant gaps of the big majority of the population. The scientists' point of view did not reach them; representations about the scientific truth are divided, precisely as a result of the lack of contact (convincingly) with scientific truth. We can even talk about a phenomenon of insecurity-information held by respondents to questions of knowledge; most answers are placed next to the answer "Probably true/false" instead of "Definitely true/false".

Many of the respondents were surprised by the survey theme, waiting rather a socio-political one. Our operators have noted, in comparison with other surveys, a lack of familiarity to answer surveys focused on questions of knowledge. However, respondents have even inquired about the number of correct answers they have given and when will be able to know the results of this research.

For this survey, the relevance of non-response is very high at some questions; the fact that the respondents chose to answer "I don't know", and their share is higher than any response, once again shows the low level of information on the environment and global warming topic.

Civic Spirit and Ecological Actions

News about weather constantly inquire 40% of respondents; news about the environment seriously attract the attention of 25%, while the theme of global warming wake up a major interest to 13%.

Topics such as water and air pollution seem to have a higher visibility and are easier to understand; it may also be the reason why they triggered the highest level of concern among the population. The next category of problems that concern the population contains the theme of global warming, but also issues such as waste, pollution from agriculture or urban pollution.

When they were asked which are the elements that associates the "environment", one of five respondents mentioned rather a matter of affective reasons related to the legacy for children; the second element relates to the proximity of particular environmental issues, 15% choosing pollution in localities. Climate fluctuation took the third place with 14%, however, reflecting a presence of this theme in the public discourse (but you have to accept that some of the answers were likely and the effect of the previous questions from questionnaire where they discussed quite a lot on the topic of climate fluctuation).

Even though the most of the population understands that environmental issues have a direct impact on their lives daily (52% - total agreement, 38% - partial agreement), when it is a question of practical actions and responsibilities, they are rather targeted to Local Public Authorities (61% - total agreement), to the Government (60% - total agreement), to specialized NGOs (54% - total agreement), while playing an active role at the personal level was mentioned by 43%.

Lack of information and education in the spirit of the protection of the environment are the main reasons explaining the current situation according to respondents (70% - total agreement). Even if there are serious complaints from the public about the high number of cars (50%) or lack of spaces designed for throwing garbage (60%), even though many (63%) require the application of fines when the rules for the environment protection are violated, when it comes to about a small effort for environmental protection, effort undertaken at individual level, the percentages change significantly. For example, only 31% would buy products which comply with the requirements of environmental protection even if they cost more.

A significant proportion of the population (between 20% and 50%) will not be motivated to reduce the water consumption, the amount of garbage they produce, the electricity consumed, the reduced use of plastic elements, etc.

Beliefs and Concerns Related to Climate Fluctuation

The majority of respondents (85%) believe that global warming is taking place, and 55% of them are very confident or extremely confident about this phenomenon. About one of ten participants in this survey (12%) share other opinion and consider that global warming is not taking place, but do have a high margin of uncertainty with regards to this argument.

Guilty for global warming would be human activities (26% - is the correct answer); other cases have been identified in human activities combined with natural changes (39%) or rather things related to natural changes (26%). Higher proportion of correct answers was given by those who believe that global warming is taking place, young people (15-29 years old), residing in small and medium cities of the Republic of Moldova; most wrong answers were retrieved among people in rural areas, persons over 45 years, with low education.

There are two major currents of opinion in terms of what respondents associated with scientists' views: on the one hand, 43% consider that the majority of scientists have established that global warming is taking place, and other 32% say that there is place for discussion and there is no consensus among scientists.

One of four citizens considered having serious reasons for concern about the global warming phenomenon, and other 48% have expressed their concerns to some extent. This feeling is present more frequently among those who believe that global warming is taking place, among women, those over 45 years old, especially rural residents. For 7% it is not a concern at all, and other 19% have reduced fear concerning the impact on their lives generated by global warming.

Perception of the Phenomenon "Greenhouse Effect"

"The greenhouse effect", as one of the main mechanisms that causes global warming, it is more known among the young population, with higher education, other than Moldovan ethnicity, resident in municipalities. At the level of the entire sample, the balance shown: 47% have heard, while 49% have not heard about the connection between "the greenhouse effect" and global warming.

Of those who have heard about the "greenhouse effect", 51% have understood correctly that it refers to "the gases in the atmosphere which are characterized by the great ability of absorbing infrared radiation"; the other 19% believe incorrectly that "the ozone layer protecting the Earth", "Pollution which causes acid rains" (18%) or how the plants grow (7%) refer to the "greenhouse effect". In conclusion, nationwide, 24% have heard and have identified the correct guidance elements pertaining to the "greenhouse effect".

Most of the participants in the survey (between 40% and 75%) identified correctly the causes that lead to the increase of average temperature on Earth: volcanic eruptions, greenhouse

gases, the amount of solid particles in the atmosphere, etc. However, there is a large proportion of people who believe incorrectly that the earthquakes (72%-very much and to some extent) or the phases of Moon (46%) can change the average temperature of atmosphere air.

60% of citizens understand that the carbon dioxide has a bigger capacity of absorbing infrared radiation, causing this way global warming; a smaller one consider the methane (41%) and water vapors (27%) can satisfy the same positive role.

Weather versus Climate

Although 73% know that "Climate means the average weather conditions (time) in a region", while 83% know that "Weather (weather) often change, yearly" the majority of the population does not make a distinction between the concepts of the terminology of climate and weather, believing incorrectly that the climate is changing frequently from year to year or that the weather means the average climatic conditions in a region.

Climate Fluctuation: "Past and Present"

The highest proportion of wrong answers were recorded in the item "Climate of the Earth is now warmer than ever in the past", 79% believe that it's certainly or probably true. This is false, because there have been times in the past with significantly higher temperatures.

Other confusions of the population concerning the planet's thermal past refer to the fact that "In the past, always the climate of the Earth was changing gradually from warm to cold periods" – 63%, "The climate of the Earth was about the same over the course of millions of years" – 42%, or that "The climate of the Earth is colder than ever in the past" – 30%.

The survey also stated that a significant part (56%) of respondents understand correctly that "In the past, the raise of the carbon dioxide concentration in the atmosphere generated by the increase of atmospheric air temperature globally"; about the same proportion (57%) also, know that the reversible process is also true – the raise of the temperature caused the increase of carbon dioxide in the atmosphere (global temperature and carbon dioxide level may influence both each other in positive or negative sense). We should mention that to these questions have been posted and a large number of non-responses (28% and 27%).

One of the two citizens understands that over the last 10.000 years we had an unusually warm climate compared with the climate of the last million years. And to this question, the share of non-responses was significant – 35%.

Nearly a quarter of the participants in the survey believe that climate fluctuations played a major role in the demise of the human civilizations from the past.

Temperature estimations

Respondents were shown the current average temperature on the Earth's surface 14.5 degrees Celsius. To the question asking to estimate the average temperature during the ice age, only 6% have shown the correct answer (between 7. 7 and 10. 6 degrees Celsius); 35% have indicated a temperature lower and 11% a higher temperature. But the dominant note is the very high proportion of people who did not know to give a response – 47%. In a similar manner there were the things in the case of estimating the average temperature 150 years ago.

For the year 2050, more than a third of respondents estimate that the average temperature will be substantially higher than the correct answer (between 15.6 and 16.1 degrees Celsius), and this indicates most a concern of the population. The share of those who have given the correct answer was low – 9%.

Fossil Fuels

In this respect, the knowledge of population is higher, over two-thirds noting correctly which fossil fuels are: coal (mentioned correctly by 80%), oil (74%) and natural gas (69%). However, as concerning the wood, hydrogen and solar energy there are major confusions, between 17% and 33% of population is considering them also fossil fuels. Segments of the deficient population in this respect are those with a low level of education, ethnic Moldovan, especially residents in rural areas.

As concerning the origin of the fossil fuels, population's knowledge is rather limited: first of all, more than 30 percent have been reluctant to give a response to this module of questions. Only 17% were confident that "the Sun through plants photosynthesis" leads to the formation of fossil fuels and other 27% incline to believe that this is probably true. 34% believe erroneously that the fossilized remnants of dinosaurs or uranium of the crust (44%) contributed to the formation of fossil fuels.

Only a quarter of the population knows that carbon dioxide stays in the atmosphere for several hundreds or thousands of years once it has been issued.

Carbon dioxide

Three-quarters of the participants in the survey responded correctly, pointing out the carbon dioxide as resultant of combustion of fossil fuels. Only one of ten respondents knows that stopping the combustion of fossil fuels would not lead immediately to a decrease in the concentration of carbon dioxide in the atmosphere. 8 percent expect miraculous effects with the suppression of the combustion of fossil fuels and the other 38% believe that the beneficial effects will be felt in a relatively short period.

Also a low share (16%) knows that stopping the combustion of fossil fuels would not lead to the immediate cessation of the global warming phenomenon. Socio-demographic variable determining the quality of the response represents the respondent's education.

Causes of Global Warming

The answers given to this section rather justify us to conclude that the vast majority of the population DO NOT knows the causes of this phenomenon. From a list of 12 possible causes, each cause has been referred in a proportion of 5% to 8% as being highly responsible, or roughly 10%-20% in some. Basically there was no distinction between correct and incorrect answers.

Arguments of Climate Fluctuations

Many of the respondents (75%) believe incorrectly that scientists cannot predict the climate for future, a high level of distrust (52%) exists in computer-generated models that could predict the climatic future.

More than a half of respondents (54%) believe incorrectly that the climate of the Earth changed naturally; and people are not those who have caused the current global warming. Even a higher number of respondents (69%) connect erroneously the causality between Sun and global warming, and about one-third expect more benefits than harm if global warming will take place.

It is to consider the fact that to all items from this section, the number of non-responses was considerable and varied between 11% and 38%.

Elements of Impact

Even though the share of responses from the answer "probably true" is almost double compared to the answers "definitely true", most participants in the survey (71%) understand that global warming will cause humidity to increase in some places, while in others, desertification; also, two-thirds of the questioned persons know that another effect of global warming will generate higher yields in some areas, while in other areas the crops will decrease. The inhabitants of the villages and those who said they know that global warming is taking place mentioned in a bigger proportion these phenomena.

Almost half of respondents (47%) mistakenly believe that global warming will cause the temperature to rise for each country.

Less than a third of citizens responded correctly and claimed that most glaciers are melting, while 11% have a more apocalyptic representation saying that all the glaciers are melting. It is to point out that 4% have not heard that the planet would live such a phenomenon.

71% understand correctly that the speed of melting glaciers grew significantly in the last hundred years. This response is significantly correlated with the share of those who considered that the phenomenon of global warming is taking place.

The rise of the sea water level is correctly connected, the rate of about 80%, to the Antarctic ice melting, to the Northern Icy Ocean (Arctic Ocean) melting, to the melting of glaciers in the mountains or ocean water warming. About half (51%) correctly associate this phenomenon of rising sea waters with the phenomenon of water evaporation.

When they were on the way to choose a single cause responsible for raising the level of sea water, participants in the poll were chosen mostly answers related to melting glaciers. However, the correct answer is "water temperature warming in oceans" and was mentioned by only 8%.

40% could not appreciate how much the level of sea water will increase unless there would be implemented concrete measures relating to the reduction of global warming. 61% have not heard anything or have heard little about the level of acidity of ocean waters – also just 11% correctly identified the cause for increasing the level of acidity of ocean waters, and namely, "Absorption of carbon dioxide in the ocean waters".

Solutions

The majority of respondents understand correctly that the following actions would contribute significantly to the reduction of global warming if it had undertaken at the level of the entire planet: planting of trees (89%), reducing the disafforestation (rainforests) (85%), fewer trips with the personal car (77%), switching from combustion of fossil fuels to renewable energy use (75%), transition from petrol-fuelled cars to those powered by electricity (74%). The intensive use of public transport (66%), the transition from fossil fuels to nuclear energy (56%), thermal insulation of buildings (49%).

But we can also speak about major confusions, at the mass level, on the adoption of solutions which in the population opinion would have the effect of reducing global warming: for example, 84% think incorrectly that less waste means a direct support given to reduce global warming; or 77% considering erroneously the limitation of size of the holes in the ozone layer by reducing missile launches; or 56% who believe inadequately that the taxes increase for the use of fossil fuels.

Sources of information

A highest notoriety on sources which present information about the phenomenon of global warming have the TV programs (88%), while the lowest notoriously recorded the information submitted by various institutions under the leadership of the Government (17%) or buildings like museums, the Zoo (13%). Other sources which are discussing this issue are: the circle of friends, relatives (66%), radio (52%), the Internet (49%) or printing press (48%). The largest impact on the knowledge obtained about global warming is in TV programs (22% say they have learned a lot from these programs) and information taken from the Internet (19%).

Classification of sources to be sought in the future for information on global warming broadly reproduces the order posted in notorious top: TV (90%), the Internet (66%), Newspapers (58%), family Members, relatives (56%), while the lowest expectations are also among institutions under the coordination of the Government or buildings like museums, Zoo.

The most trusted source of information on the phenomenon of global warming, are scientists (74%) and TV documentaries (70%) which can be watched on channels such as Discovery. It should be mentioned that, in the list of sources presented, teachers are less confident – only 12% said that they have very much confidence, and another 38% having some confidence.

Preferences on sources of information are significantly influenced by socio-demographic characteristics: for example, women, young people, people with higher education, ethnic Moldovans, residents of municipalities prefer as a source of information the TV documentaries; those over 45 years, the villagers prefer rather information mediated by the interpersonal relations with acquaintances or relatives.

The contact with diverse backgrounds that could transmit information about climate fluctuation is extremely low – about 85% have stated that in the last 12 months have not visited a Museum of natural sciences and Museum of science and technology; zoos or cinemas were also ignored in the last year of over two-thirds of the population. The main cause for this situation is related to the small number of such buildings nationwide and their poor promotion.

58% need more or much more information about the phenomenon of global warming. Categories of the population requiring insistently this are the ethnic Moldovans, those with secondary education, from small and medium-sized cities, but also those who live in villages.

Methodology

1. Sample:

- stratified, probabilistic, three-stages;

2. Sample volume:

- 804 respondents, 15 – 65 years old;

3. Stratification criteria:

- 12 administrative-territorial unit (ATU). Residential environment (urban-rural). The size of urban settlements (4 types). Type of suburbs (commune center / affiliating village);

4. Randomization stages:

- Locality (62 selected localities) Establishment / Family; Person;

5. Representativeness:

- The sample is representative of the adult population of the Republic of Moldova, excluding Transnistria;
- The sampling maximum error is $\pm 3,5\%$;

6. Interviews:

- Interviews realized at the respondents' domiciles by 33 operators of the IMAS network in Romanian and Russian language;

7. Data collection period:

- May 29 – June 16 2011;

8. Sample Structure

9. Beneficiary: Climate Change Office of the Ministry of Environment of the Republic of Moldova

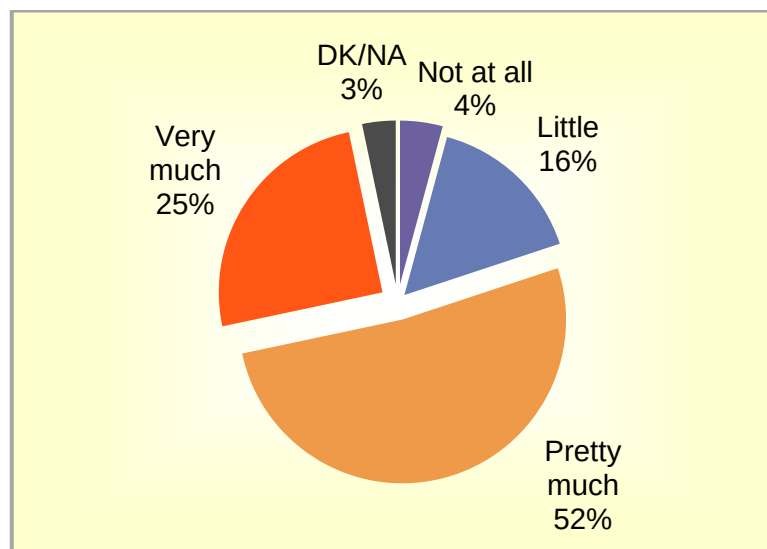

The beneficiary of the survey is Climate Change Office of the Ministry of Environment of the Republic of Moldova, the activity being realized in the frame of the Project “Republic of Moldova: Enabling Activities for the Preparation of Third National Communications under the United Nations Framework Convention on Climate Change (UNFCCC)”, implemented by the Ministry of Environment of the Republic of Moldova and United Nations Environment Programme (UNEP), with financial support of the Global Environment Facility (GEF).

Note: throughout this report, for questions of knowledge, some answers are going to be encircled, using a frame of this type: ☐ This will underline the correct answer (the one corresponding to the scientific truth).

Civic spirit and ecological actions

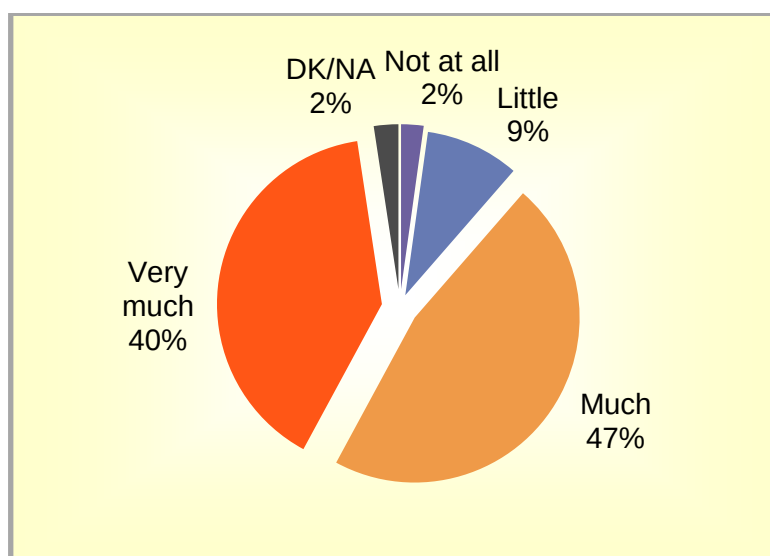

D44. How much or little are you interested in news on global warming?

% on the total sample of all 804 respondents

Climate fluctuation: past and present

D13. To what extent do you think the following statements are true or false?

% on the total sample of all 804 respondents

	Definitely False	Probably False	Probably True	Definitely True	DK/NA
a. In the past, the Earth climate tend to change gradually from warm to cold periods	3,5	13,0	39,7	22,8	21,0
b. Climate change played a major role in disappearing of human civilizations in the past	3,0	9,6	39,7	33,8	13,9
c. Today, the Earth climate is warmer than ever	2,4	9,3	46,9	32,3	9,1
d. In the past, increased concentration of carbon dioxide in the atmosphere led to growth of air temperature at the global level	2,8	12,8	38,5	17,7	28,2
e. In the past, growth of air temperature led to high concentration of carbon dioxide in the atmosphere	3,9	12,2	38,2	18,7	27,0
f. Comparing to the climate of the last million years, the last 10.000 years we've had unusually warm climate	2,9	12,6	31,2	18,8	34,5
g. The Earth climate remained the same within last million years	17,0	22,9	30,4	11,8	17,9
h. Today, the Earth climate is colder than ever	29,5	29,6	19,3	10,9	10,7

% on the total sample of all 804 respondents - In the past, the Earth climate tend to change gradually from warm to cold periods

Temperature Estimation

D14. The average Earth temperature is about 14.5 Celsius degrees. What temperature do you think was on Earth during ice age?

Response:	Percentage
Temperatures below 7.7 Celsius degrees	35.1%
Right answer (between 7.7 and 10.6 Celsius degrees)	6.2%
Higher temperatures of 10.6 Celsius degrees	11.4%
Don't know/ No answer	47.3%

D28. The average Earth temperature is about 14.5 Celsius degrees. What temperature do you think was 150 years ago?

Response:	Percentage
Temperatures below 13.3 Celsius degrees	36.7%
Right answer (between 13.3 and 13.9 Celsius degrees)	6.8%
Higher temperatures of 13.9 Celsius degrees	9.1%
Don't know/ No answer	47.4%

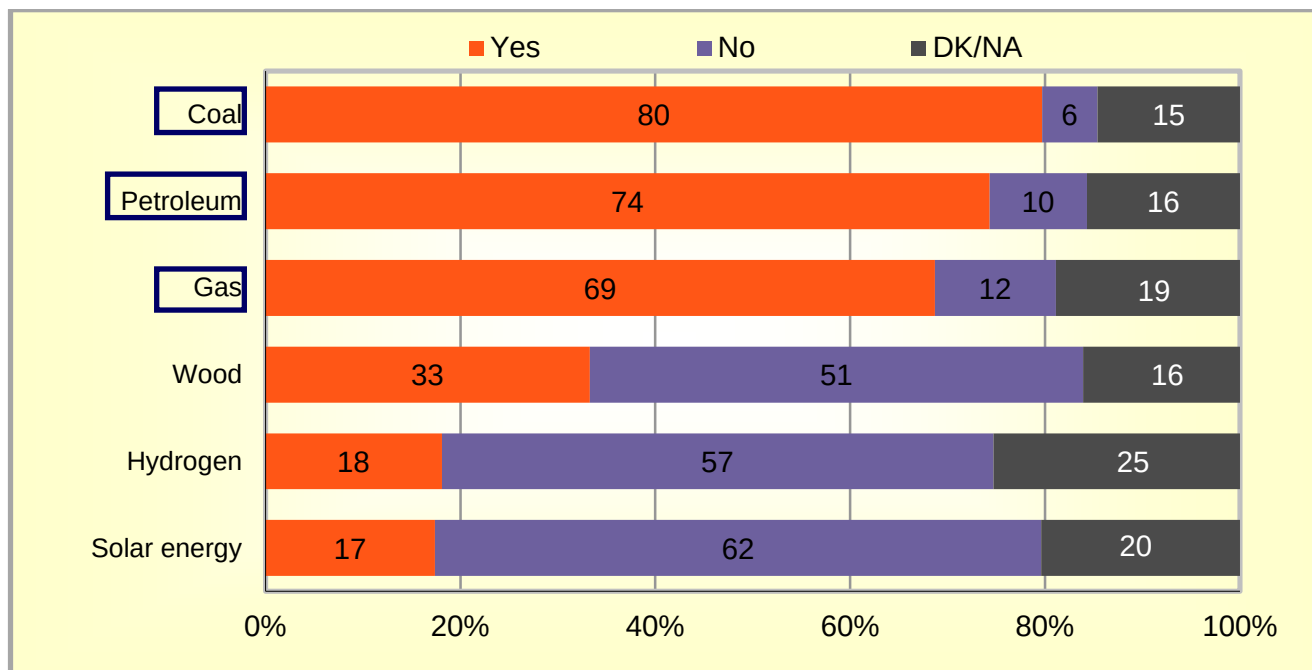

D29. The average Earth temperature is about 14.5 Celsius degrees. What temperature do you think will be in 2050, if no additional actions to reduce global warming will be carried out soon?

Response:	Percentage
Temperatures below 15.6 Celsius degrees	13.4%
Right answer (between 15.6 and 16.1 Celsius degrees)	9.0%
Higher temperatures of 16.1 Celsius degrees	34.4%
Don't know/ No answer	43.2%

Fossil Fuels

Arguments of Climate Fluctuations

D30. To what extent do you think the following statements are true or false?

% on the total sample of all 804 respondents

	Definitely false	Probably false	Probably true ^a	Definitely true	DK/NA
a. In some places, global warming will cause high humidity, and in others desertification	2,9	10,3	45,7	25,6	15,5
b. Scientists can predict the weather for the next 7-10 days, yet they still cannot predict the climate for longer period	3,9	15,0	41,8	23,6	15,7
c. Global warming leads to higher yields in some areas, whereas the other areas might have decreased yields	6,2	13,4	43,5	23,7	13,2
d. Computer generated climate models made by scientists, are not trusted, since they can predict the future climate (for tens and hundreds of years)	5,0	15,0	35,1	17,1	27,8
e. In the 70's of last century, many scientists foresaw an Ice Age	11,0	16,0	25,2	9,6	38,2
f. In the past, the Earth climate changed naturally; therefore people are not those, who caused global warming	11,5	20,7	35,1	18,8	13,9
g. Global warming will cause temperatures to rise equally in all countries	13,7	23,1	31,8	15,6	15,8
h. The recent global warming is caused by the Sun	6,1	13,2	44,5	24,4	11,8
i. Actually, the Earth cools, not heats up	30,1	28,8	20,2	8,7	12,2
j. Global warming takes place, but there are more benefits than harm	31,6	26,1	20,4	10,8	11,1

% on the total sample of all 804 respondents - In some places, global warming will cause high humidity, and in others desertification
